Incident Management Policy

Document Type: Policy Knowledge Document

Purpose

Define basic rules for incident analysis, communication, and resolution in an enterprise application support environment.

Policy 1 - Evidence Based Analysis

Incident conclusions must be based on available logs, monitoring information, application behavior, configuration, and validated evidence.

Policy 2 - No Unsupported Root Cause

A root cause must not be stated as confirmed when the available evidence does not establish it. In such cases, the cause should be recorded as undetermined or under investigation.

Policy 3 - Business Impact

Incident records should clearly identify the affected application or service and the observable business impact.

Policy 4 - Preventive Actions

Preventive actions should address the identified contributing factors and should be traceable to the incident analysis.

Policy 5 - Communication

Incident communications should distinguish confirmed facts, observations, assumptions, and actions in progress.

Context

This policy applies to enterprise application support and incident management activities.
