E-Commerce Order Processing Facts

Document Type: Fact Knowledge Document

Purpose

Reference facts for e-commerce order processing and downstream integration.

Fact 1 - Order Flow

An e-commerce order can pass through multiple downstream systems before reaching the fulfillment or warehouse platform.

Fact 2 - Integration Dependency

A failure in an intermediate integration component can prevent subsequent orders from being processed by downstream systems.

Fact 3 - Data Validation

Successful validation by an address validation service indicates that the service accepted the submitted address according to its validation rules. It does not necessarily establish that the original source value was semantically correct.

Fact 4 - Source Data

When an integration passes a source-system value without transformation, analysis should first compare the source value with the downstream value to determine whether a transformation occurred.

Context

These facts apply to e-commerce order and integration analysis.
